The problem taken in this research is the 5 to 6 year old kid's exploration ability which is in fact has not optimally developed at TK Amarta Tani HKTi Bandar Lampung. The objective of this research is to know the corelation between natural based learning activities and the 5 to 6 year old kid's exploration ability. This reasearch is a non experimental quantitative research, by using the analisis of corelation. The data collecting technics used are interview, observation and documentation. The data analisis technics used are by analyzing the cross table and the Corelation Speraman Rank. The result show that there is tight corelation between natural based learning activities and the 5 to 6 year old kid's exploration ability by reaching 0,67 persen. As conclusion it is recomendeed to involve more natural based active learning to develope the 5 to 6 year old kid's exploration ability.

Keywords : Exploration ability, natural based learning activities, the 5 to 6 year old kids.
