This research aims to know whether the average length of school and income per capita impact on Contraceptive Prevalence Rate (CPR), whether the average length of school and income per capita income on the average age at first marriage, whether the average length of school, per capita income, Contraceptive Prevalence Rate and the average age at first marriage affect on the Total Fertility Rate. And whether Total Fertility Rate impact on the level of poverty in Lampung Province.

The model used is path analysis models, that it is processed using AMOS. Data obtained from the results of Indonesian Demographic and Health Survey (IDHS) from 1991-2012, the Central Bureau of Statistics, the National Population and Family Planning Representatives of Lampung Province.

The Research results showing that the average length of school affects Contraceptive Prevalence Rate (CPR), while per capita income did not affect Contraceptive Prevalence Rate (CPR). The average length of school and per capita income affects the average age at first marriage. The average length of the school, contraceptive prevalence rate, the average age at first marriage affect the Total Fertility Rate (TFR), while per capita income has no effect on the Total Fertility Rate (TFR). The Total Fertility Rate (TFR) affect the level of poverty in the province of Lampung. In this study the average length of school and per capita income has a high correlation. A phenomenon that occurs in Lampung Province with the second largest population of the island of Sumatra, the income per capita is relatively low and the average length of schools reach seven to eight years also contributed to the high Total Fertility Rate.

Keywords: The average length of school, per Capita Income, Contraceptive Prevalence Rate (CPR), the Average age of First Marriages, Total Fertility Rate (TFR), Level of Poverty.
