Income is a picture of the family's economic position in society, which consists of three levels, namely low income, income medium, and high income. To be able to keep a good position in terms of income levels, parents are required to work hard and be involved in routine jobs are monotonous and saturate.

As a result of human monotonous job often feel bored, is no exception teens, they often feel boredom, because the teenager is also an individual who is inseparable from the obligation either at home, at school, as well as within the organization. Therefore they need something that can cope with bored.

One attempt to overcome their bored is a recreation, leisure time is filled with activities that are not routine work. Recreation conducted by the recreation of adolescents vary conducted in childhood. adolescents who come from poor families. Economically or middle-income parents or older, get more opportunities in choosing a form of recreation, while for adolescents whose parents have low incomes the opportunity to choose a favorite form of recreation is limited.

This study uses quantitative methods that are analyzed descriptively describe the subject and object of research as it is at the time of this research is done. Based on survey results revealed that adolescents whose parents have high income are more likely to choose different forms of recreation that require high costs. Adolescents whose parents income is being conducted recreation costs are not too high. While teens are low-income parents who do it as well as recreation facilities needed is simple and requires only a small cost or even no cost.
