

ABSTRACT

DESIGN OF MULTI I/O (120 I/O) COMPUTER CARD BASES ON PPI 8255 PROGRAMMABLE

By

IRMAN SEPTIANSYAH

In computer system, a lot of facilities are offered by each of computer type, from the old type of computer until the very newest type. One of facility that being offered is slot that available in motherboard such as ISA slots (Industry Standard Architecture). To use this slot facility, a computer card is needed. Computer card that will be design in this research have a general function as I/O (input/output) component that can be programmed.

IC PPI 8255 embedded to computer card which has 120 I/O facilities. PPI was a chip that been design to used in microprocessor system. In this case, 5 pieces of IC PPI 8255 is needed to supply 120 I/O, so it is necessary to addressing each of PPI 8255. For 1 IC PPI 8255 needs 4 addresses which 1 of address is for Control port and the other port I/O. Addressing for this computer card is processed by 2 pieces of IC Decoder 74LS138. Computer card that designed in here is address at 768 to 787. Data process that happened in this computer card is able to result and to receive data. Chip Select signal's in each of PPI 8255 confirming computer card is access or not.

From this computer card, facility uses that offered by computer can be more effectively the benefits obtained. In addition, computer cards can also be used to assist humans in solving problems that occur.
