ARDIO VANNY PRATAMA

Each region in implementing economic development supported by the available resources, both natural resources and human resources on hakekatna aimed at improving the economic progress and improving welfare. In addition to the economic development is basically meant to reduce income inequality that occurred in an area, so it is able to create economic development and equitable distribution of income distrbusi public welfare. The problem in this study is whether the economic development that occurred in West Lampung regency from 2005 to 2011 were relatively high (average 6.28 percent) followed by the reduction of income inequality.

This research aims to determine whether economic development will reduce the level of income inequality. Measurement of the degree of inequality that occurred in West Lampung regency period from 2005 to 2011, the Gini coefficient is used, while for see the extent to which economic growth can reduce income inequality then used a qualitative analysis tool, the analysis is done based on the processing of data obtained by means of analysis of the formula associated with the problem, the Gini coefficient and the rate of economic growth based on the variable per capita income growth and income inequality observed in West Lampung in the year 2005-2011. The hypothesis of this paper is: "Allegedly showed a negative relationship between economic growth and inequality: an inverted U-shaped effect in West Lampung regency."

Along with the advanced state of the economy and the high rate of economic growth in the West Lampung regency, Has driven the improvement in the level of welfare in the community, although as we all know the level of income inequality in the West Lampung still classified as severe inequality. The occurrence of relatively severe income inequality in West Lampung not happen does not mean peace in society.

Keywords: GDP, Per capita income, income distribution West Lampung.
