

Abstract

**THE LEVEL OF PUBLIC KNOWLEDGE ABOUT
THE PRIVATE GREEN OPEN SPACES
(Study in Rajabasa Permai, Rajabasa, Bandar Lampung)**

By:
Monica Tamara

This study aims to determine the level of public knowledge about the private green open space. This research uses descriptive method with quantitative approach. This research was conducted in Rajabasa Permai, Rajabasa, Bandar Lampung. The population in this study as many as 253 households. The sampling technique using Slovin formula, with a significance level of 10%. Samples obtained in this study were 72 respondents. Sampling technique using a simple random sample. The level of knowledge in this study using measurements that include 6 levels of Bloom, ie to know, understand, application, analysis, synthesis and evaluation. But in this study used only two levels, namely to know and understand, and coupled with do not know. Results from this study showed that 47% of people know, 15% of people understand, and 38% of people do not know. The level of public knowledge about green open space is at a level know. Such knowledge can be enhanced with various strategic efforts, namely: (1) the rule of law, (2) adding environmental sustainability education curriculum, (3) dissemination of the importance of green open space through a variety of strategic media.
