Development and economic growth is one picture of development activities in various economic sectors, with the aim to increase the income level of the community and address the economic disparity and social inequality. The economic disparity in question is that income inequality is a condition in which the distribution of income shows the state of the uneven and more profitable a particular income group. The problem in this paper is "Is there a negative correlation between inequality of income distribution with economic developments in the West Lampung".

This research aims to find out, whether there is a negative correlation between inequality of income distribution with Economic Development in West Lampung regency. This research is a descriptive study, in which the writing is intended to describe or depict economic growth with income distribution gap by regional conditions. Analysis was done qualitatively and quantitatively. In general, the pace of economic development of West Lampung in 2006 - 2012 is likely to increase. Only in the year 2010 alone the rate of economic growth in the West Lampung slightly decreased. Inequality of income distribution in West Lampung in 2007 - 2011 is still in the category of weight disparities but tends to be more evenly distributed, but in 2012 the level of inequality of income distribution in the district is in the category of moderate gap.

It can be concluded that the economic development and income distribution gap in West Lampung regency associated negative or opposite direction.

It means that the economic development in the West Lampung have lower levels

of income inequality, so that income distribution became more even though it is still in the weight category, the exception in 2012.

Keywords : Negative correlation analysis, income distribution gap, economic development.
