HASTIARI ZAHARA

ABSTRACT

Inequality of economic often used as an indicator of differences in income per capita on average, inter-group income levels, employment among groups, and between regions. This study aims to provide empirical evidence about the influence of labor, private investment and development assistance funds allocated to the inequality of economic development. This study uses panel data consisting of 10 districts in the province of Lampung. Calculation shows that the variable labor, private investment funds and development assistance allocations affect the inequality of economic development in the Lampung Province either partially or jointly. But in partial allocation of development assistance funds have a positive effect on the level of inequality of economic development in Lampung province during the study year 2008-2012.

Keywords: inequality of economic development, employment, private investment, development assistance funds allocation, panel data, random effect.
