**ABSTRACT**

The purpose of this study was to analyze the effect of a variable number of unemployed and the Human Development Index (HDI) of the number of poor people. The analysis tool used is multiple linear regression analysis model with the method of least squares (Ordinary Least Square). This study uses annual time series data obtained from the Central Bureau of Statistics and the Department of Labor. Based on the results of ordinary least square regression, it is known that in partial unemployment and a variable number of the Human Development Index (HDI) provides a significant positive effect on the number of poor in Metro City.

**Key Words:** The number of poor people, the number of unemployed, The Human Development Index (HDI).
